

Micropross presents a new product – MP60

March, 31st 2008, Lille – France

To respond to the continuous growth of SIM chips embedding mass storage functionalities, Micropross designs a new product: the MP60.

This small desktop contact reader withstands ISO/IEC 7816, USB 2.0 and SWP protocols and is intended to simplify smart card applications development. Its flexibility enables to test the smartcard accurately defining conditions as voltages or adjustable frequency.

Its multi task operating system allows to communicate with the smartcard using several protocols at the same time, and thus check the correct operation of the device-under-test under those conditions.

Developed with an userfriendly approach, this reader is provided with the MPScope software which opens all the MP60 functionalities to the user without the stress of programming.

About Micropross

Micropross was established in 1979 and is headquartered in Lille, France. Micropross is the world's leading supplier of both contact and contactless test tools for the smart card industry. For many years, Micropross has been working closely with the main manufacturers to offer a full range of products dedicated to the smart cards industry. Worldwide used, its products are design to develop and produce faster and better.
